#### Introduction

Before declaring 2008 as the International Year of Potato, FAO was precisely assessed the significance of potato as future crop for fighting hunger and poverty. Role of potato as food and income security crop for the global poor in general and the residents of developing countries in particulate, was adequately documented by many researchers.<sup>1</sup>

The potato (Solanum tuberosum) being a staple food of humanity is one of the world's major agricultural crops and is the most important and versatile food around the globe. It is the world's fourth significant food crop after wheat, rice and maize because of its higher yield potential along with high nutritive value. With an annual global production of about 370 million tonnes<sup>2</sup>, potato is an economically important staple crop in both developed and developing countries.

In comparison with other food crop, it yields more protein and calories per unit area per unit time and per unit of water. It also comprises phosphorus, calcium, iron and some vitamin A & C. The protein calorie ratio is high. It is versatile, carbohydrate-rich food, highly popular worldwide and prepared and served in a variety of ways, making them a good source of energy. Freshly harvested, it contains about 80 percent water and 20 % dry matter. About 60 to 80 % of the dry matter is starch. As a food item, potato has widespread acceptance across cultures and social classes and plays major role in day today life.

Being a cool season vegetable, it is a perishable commodity and cannot be preserved longer in fresh form. Although for some time potatoes can be preserved at cold storage units but this low temperature storage results in many undesirable biochemical changes in the quality of the potatoes. Another alternative for the preservation of them is to conversion in the shelf stable value-added processed products. Further, value-addition and processing of potato will also ensure the availability of wholesome, safe, nutritious, and acceptable food to consumers throughout the year along with simultaneous reduction in post-harvest losses and profit to the farmers for their produce.

<sup>2</sup> <u>http://www.fao.org/faostat/en/#data</u>

<sup>&</sup>lt;sup>1</sup> Thiele G, Theisen K, Bonierbale M and Walker T. 2010. Targeting the poor and hungry with potato science. Potato Journal 37(3-4): 75–86.

#### Global scenario – Potato

Potato, widely known as 'The king of Vegetables' is a major food crop grown by more than 150 countries in the world and more than a billion peoples diet consist of potato. About 370.43 million tonnes of potato are produced in the world over an area of about 17.34 million hectare. Presently China, India, Russia, Ukrain, and U.S.A. contribute to a major share (70%) of the total world production. According to the analysis of FAO, China is the largest producer of potato with the production of 91.88 million tonnes followed by India with more than half of the total potato produced by China.<sup>3</sup>

## India scenario - Potato

Being the second largest producer, India occupies a prominent position on world potato map. India produced 50.19 million tones potatoes (13.54% of world production). Since 1990, per capita consumption of Potatoes has risen from around 12 kg to 26kg per year in 2018.<sup>4</sup>

Its cultivation in India not primarily a rural staple but a cash crop that provides significant income particularly to small and marginal landholders and fitted well in the existing cropping system. Potato production in India is highly concentrated in Gangetic plains as three largest potato producing states, viz. Uttar Pradesh (30.33% of national production), West Bengal (24.92% of national production) and Bihar (15.09% of national production), collectively contribute about 70% to the national production.<sup>5</sup>

## Bihar Scenario

Bihar represents the great Indo-Gangetic plains, one of the most fertile lands of the world. It offers salubrious agro-climatic conditions for Potato Cultivation. It is the fourth major food crop of state after rice, wheat and maize. Although the crop occupies less than five percent of the net sown area across the State, due to its high nutritional value, it is an important source of food for millions of people across Bihar. Production of potato comprises of 7.740 million tonnes which is 48 % of the total production of vegetables produced in the state.<sup>6</sup> The decadal growth in potato production and yield is significantly increasing.

Potato is cultivated all over the Bihar, among which Nalanda, Patna, Vaishali, Saran, Muzaffarpur, Samastipur, Gopalganj, East and West Champaran, and Gaya account for 80 percent of the area. In terms of production, Nalanda, Patna and Vaishali are the foremost districts.

Growing potato also provides excellent opportunities to raise farmers' incomes in Bihar as it has the capacity to yield 5-10 times more than cereals, pulses or oilseeds. The high profitability of potato as a cash crop has made it an economically viable enterprise for small and marginal farmers and has contributed to increasing equity among farmers. Potato provides a high unit return and offers great scope for value addition. In this respect the crop generates high employment during not only during production and harvesting but also processing and marketing

<sup>&</sup>lt;sup>3</sup> http://www.fao.org/faostat/en/#data/QC

<sup>&</sup>lt;sup>4</sup> https://www.helgilibrary.com/indicators/potato-consumption-per-capita/india/

<sup>&</sup>lt;sup>5</sup> http://apeda.in/agriexchange/India%20Production/India\_Productions.aspx?cat=Vegetables&hscode=1083

<sup>&</sup>lt;sup>6</sup>https://agricoop.nic.in/sites/default/files/Horticulture%20Statistics%20at%20a%20Glance-2018.pdf

Fig 1 Increase in the production and yield of potato<sup>7 8</sup>

Increase in production, often resulting in gluts at harvest, has led to several post-harvest issues like storage and proper utilization of the produce. Since potato tubers contain about 80% water, under such environments, a semi-perishable commodity like potato, cannot be stored for more than 3-4 months without refrigeration because of very high losses to the produce due to shrinkage, sprouting and attack by microorganisms. Therefore, these potatoes either need to be stored at low temperatures or processed into some products.

The highest productivity of this crop in the India is the Indo-Gangetic plains region. It is estimated that 25% of the potatoes, which are spoiled due to various reasons such as transportation, type of packing, non-availability of cold storage capacities during harvesting season, glut in the market etc., could be saved by making various preserved potato products. Potato Chips is one of such value-added products which has a great potential as this is considered as one of the traditional foods of India.

<sup>&</sup>lt;sup>8</sup> Singh, S.K. and R.P. Rai, 2011, The Potato Crop in Bihar: Status and Future Challenges, *International Potash Institute, e-ifc No. 27.* <u>https://www.ipipotash.org/uploads/udocs/eifc\_no27-rf1.pdf</u>

#### 1. Background

#### **Definition:**

Potatoes is probably the most popular food item of world diet. It is a rich source of starch and contains phosphorus, calcium, iron and vitamins. In merely half a century industrial processing of potatoes into consumer products has developed into a major activity in the potato world. Apart from using fresh potatoes in vegetables and gravy they are dehydrated in the forms of slices and sticks, cubes or powder to impart better shelf life. They are utilized in a variety of ways a:

In an increasingly fast society, there is growing demand for snacks that are easy to buy, store and eat, with an increasing number being eaten 'on the move'. Globally, only two potato-based snack foods i.e., chips/wafers and French-fried potato are the main value-added products of potato, accounting for more than 42% of the potato based processed products. With this background, the potato wafers and chips market seem to hold good growth prospects.

#### **Global Scenario:**

Due to changing lifestyles, consumers are not only opting for easy food options but also looking for authentic and natural snack options with health & wellness attributes, which influencing per capita expenditure in the savory snacks' products including potato chips. Their consumption levels vary extensively across regions across the globe and also has a massive sale in the salty snacks' category. The United States and Western Europe currently represent the biggest markets accounting for nearly two thirds of the total global demand. Growth rates in these markets, however, have reached maturity levels. Additionally, the per capita expenditure on savory snacks products is growing in developing economies such as India and China and is supported by rising disposable income in the countries. Major factors driving the global demand of potato chips are growing urbanization, rise in disposable incomes, large and growing young population and rapidly changing lifestyles. It is going

to be one of the lucrative sectors all over the world where the global market reached a value of USD 31.87 billion in 2020. The market is expected to further grow in the forecast period of 2021-2026 at a CAGR of 2.8% to reach USD 36.59 billion by 2026.<sup>9</sup>

The global potato chips market is highly imploding with the presence of numerous small and large manufacturers who compete in terms of prices and quality. Some of the leading players operating in the market are as:

<sup>&</sup>lt;sup>9</sup> https://www.expertmarketresearch.com/reports/potato-chips-market

#### Market Segmentation:

#### Indian Scenario

Till the 90's era, Potato processing in India was not in vogue. But in recent years the demand for processed potato products in the country has risen at fast pace due to increased urbanization, rise in per capita income, expanding tourism and with the openings of organized processing by multinationals and indigenous players, potato processing industry has grown manifolds. Presently about 8% of potato production is being used for processing and the major part of potato harvest (approximately 68.5%) goes to domestic table consumption.<sup>10</sup> Whereas, in the developed countries, table potato utilization is merely 31%, rest being frozen French fries (30%), chips and shoestrings (12%) and dehydrated products (12%).

In India, potato processing industry mainly comprises four segments: potato chips, French fries, potato flakes/powder and other processed products. However, potato chips still continue to be the most common and popular processed product

<sup>&</sup>lt;sup>10</sup> https://indianexpress.com/article/cities/ahmedabad/about-16-of-potatoes-produced-in-country-dumped-as-waste-6241880/

and presently constitute 85% of salty snack business valued at nearly 2.6 billion U.S. dollars in 2017, growing at 18.7 percent to reach 5.5 billion dollars by 2022.<sup>11</sup>

Development of processing cultivars namely Kufri Chipsona-1, Kufri Chipsona-2 and Kufri Chipsona-3 which is now being used by the industries for processing, has accelerated growth in processing sector. The graph shows the share of Potato chips in India where the sale of branded chips sold by manufacturers across India is dominated by a handful of big companies.

Haldiram's 'Chips' brand, the company holds a meagre percent of market share for nationally branded potato chips, tussling with Balaji Wafers (at 16%) and ITC (on 9%), with all three some way behind PepsiCo, which accounts for 50% of sales.<sup>12</sup>

# <u>Bihar</u>

Bihar, being the third largest state in production of Potato (7.74 million tonnes) lacks in potato processing. Because it is a vegetarian delicacy and is a part of almost all Bihari culinary dishes. The produce is mostly marketed fresh with negligible processing and value addition. There are no organized processing industries in the state. Less than 1% of the potato is processed in Bihar and appears a great potential of potato processing.

Even though no production and consumption figures are available for this segment in the state, industry estimates suggest that there are large numbers of players, over 1,000, mainly in the unorganized sector. While the unorganized sector caters to mainly the rural markets, the national brands and large players mainly cater to the urban markets. The unorganized sector is burdened with the use of low, dated technologies, which presents issues of food safety, quality and lower recovery. As a matter of the fact with proper development of markets, cold storages, transportation and processing, potato products can be marketed to other states and even to foreign countries, which will improve the farmer's income.

<sup>&</sup>lt;sup>11</sup> https://www.statista.com/statistics/562644/market-share-of-potato-chips-in-india-by-company/

<sup>&</sup>lt;sup>12</sup> https://www.statista.com/statistics/562644/market-share-of-potato-chips-in-india-by-company/#statisticContainer

Therefore, in recent years, a sharp rise in potato chips consumption have encouraged Bihar farmers to shift towards potato cultivation and its processing, leading to its adoption in maximum part of Bihar So, there is wide scope of increasing chips production in Bihar towards achieving the goal of doubling farmers income through cultivation and processing.

## 2. Project Background

Potato is a perishable commodity and its harvest time (Feb/March) tailed with steep rise in temperature in the Bihar. From April onwards, temperatures in the state start shooting up and the produce has either to be consumed within a short period or is required to be shifted to the cold stores. Due to inadequate, expensive and unevenly distributed refrigerated storage facilities, there are frequent gluts in the market causing substantial economic loss to the farmers and wastage of precious food. Under the existing circumstances, processing of the potato into various processed products is a viable option which can help to extend the shelf-life, reduce the post-harvest losses, solve the problem of storage, cater to consumer preferences belonging to different age groups and social strata and serve as a means to increase the supply in off seasons thus maximizing the potato utilization and increasing the farmers income.

Demand for chips continues to rise at significant rate worldwide with the emerging trend of westernization of food consumption patterns in addition to growing economy, rise in middle class population and increasing urbanization. Moreover, with the increase of infrastructure development such as metro station, cinema halls, airport and others, the demand is expected to rise further in the developing countries particularly in India. Production of chips is increasingly moving to domestic production in many parts of state, and therefore opens opportunities for sourcing of ingredients from domestic production.

The main objective of the potato chips making is to ensure a supply chain that meets their ever-increasing demand for high-quality products in its healther form that may be stored and supplied to different markets locally as well as globally throughout the year. Processing not only helps in changing its forms which are easy to use and convenient to prepare any other products but also increases its shelf life.

Proposed project would include warehouse for storage, processing and packing facilities of chips. This unit will be equipped with modern machineries for cleaning, sorting, grading, processing and packing equipment. Standard packaging will be done to retain the quality of the product and increase shelf life and will fetch better price of the produce. After processing, the products would be supplied to the market through distributors/ wholesalers/ retailers.

## Current status of the unit:

- a. Items to be manufactured: Potato Chips
- b. Capacity of the plant: 500 Ltr/hr.
- c. Source of power generation/electricity: Electricity form BSPHCL/SBPDCL, DG Set
- d. Source of water supply: Own Borewell
- e. Connectivity to road/railways:NH/SH details along with distance
- f. Mode of transport:Pickup/Truck/Others
- g. Market:Details of local market/other market
- h. Employment Generation:14 nos.
- i. Marketing:
- j. Waste disposal:ETP/STP

## 3. Organizational and Promoters Details

#### **Organizational details**

## Promoters' Background

The unit is a proprietorship/partnership/private limited company/ firm and the proprietor/partners/promoters of the firm has experience in trading of fruits and vegetables and is associated processors. He/They has/have identified fruit juice industry as a profitable business seeing its ever-increasing demand in the local market as well market in the neighboring districts and States. Brief profile of the proprietor/partners/promoters is given below:

Brief profile of promoters is given below:

a) Mr. ABC

b) Mrs. XYZ

#### c) **Mr. <u>DEF</u>**

#### Networth: The details of the networth of the unit is given below:

Particulars			Rs. In lakh
Movable assets	A		
	В		
	С		
		Subtotal (A)	
Immovable assets	A		
	В		
	С		
		Subtotal (B)	
		Total	

The total net-worth is more than the proposed grant of the unit.

## 4. Project Description & Flow Sheet:

Chips are very popular amongst all age groups especially young population. This industry is very large and is dominated mainly by local manufacturers. Easy availability, freshness and competitive price are the main features. These products can be made anywhere, where there is availability of raw material without much difficulty.

Processing technology for the unit has been chosen carefully keeping in mind the best practices observed in India and local processes that may add unique value to the final produce. The proposed technology has also taken into consideration the market factors affecting the quality of the final produce.

#### Details of the technology and process are given below:

The proposed project would procure the raw materials either from local market or from the farm level. After processing, the products would be supplied to the market through distributors/ wholesalers/retailers. The Potato Chips Processing is differentiating with three different models as per the project suitability

- Manual potato chips line
- Semi-automatic potato chips processing line
- Fully-automatic potato chips production line

## Manual Potato Chips processing:

The low-end chips Processing technology has been suggested for Manual potato chips line. The first step taken out is grading and sorting of potatoes so that the damaged potatoes are taken out manually. The potatoes are washed thoroughly under running water and peeled by means of an abrasive potato peeling machine. The peelings are washed away with sprays of water. They are then trimmed and placed in water to prevent browning. After that using slicing machine slices (1.7-1.85 mm. thick) are made. The slices are again placed in cold water whenever there is considerable delay in the subsequent operations of blanching. Then slices are kept in water containing0.05% potassium metabisulphite to avoid oxidation. The slices are blanched for 3 to 5 minutes in boiling water and spread on trays at the rate of 4.88 kg. to 7.30kg. per square meter of tray surface. The blanched chips are then subjected to D-Watering machine to remove excess of water and fried in edible oil at 180-240°C, for 3-4 minutes. The fried potato wafers are then kept on the sieve to remove excess of oil, cooled and other ingredients like salts, spicy mixture is sprayed as per required taste using batch type flavoring machine. Cooled potato chips are then packed in polythene bags and sealed.<sup>13</sup>

# Manual Potato Chips Processing Line Operating Model Flow-Chart

<sup>&</sup>lt;sup>13</sup> https://www.nedfi.com/sites/default/files/Project\_Profile/Potato%20and%20Banana%20Chips.pdf

## Semi-automatic Potato Chips processing

A semi-automatic potato chip processing line has similar functions as that of fully automatic potato chips production line. It is a combination of batch & continuous processing arrangement, specially designed for small and medium scale chip manufacturer. It is an economy line in which all major operations are automated except peeling and slicing rest of process is similar like Manual potato chips line.

## Fully automatic potato chips production line processing

The fully automatic Potato Chips line is a continuous processing arrangement, mainly designed for processing into delicious potato chips and packaging of it with excellent quality and less fat pickups.

In this model, as the potatoes arrive at the plant, they are examined and tasted for its quality. Some are punched with holes in their cores so that they can be tracked through the cooking process. The potatoes are also examined for green edges and blemishes. The pile of defective potatoes is weighed; if the weight exceeds a firm's present allowance, the entire truckload can be rejected. The potatoes move along a conveyer belt to the various stages of manufacturing. The conveyer belts are powered by gentle vibrations to keep breakage to a minimum.

# Fully automatic Potato Chips Processing Line Operating Model Flow-Chart<sup>14</sup>

<sup>&</sup>lt;sup>14</sup> https://www.economodefood.com/potato-chips.html

# • Destoning and peeling

In this unit, potatoes laded into screw conveyer where they are pushed to the automatic peeling machine for peeling. After this they are washed with cold water.

## Slicing

Slicing is done through a revolving impaler/presser that cuts them into paper-thin slices (Size 1.7-1.85 mm). Regular size chips were made using Straight blades while ridged chips by rippled blades. After that, the starch released during slicing is removed by cold water wash. Recently some manufacturers, who market their chips as natural and healthier, do not wash the starch.

## <u>Color treatment</u>

At this stage, the potato slices are immersed in a solution that has been adjusted for pH, hardness, and mineral content treated to enhance their color and appearance.

## • Frying and Flavoring

Before frying, the slices pass under air jets which remove excess water and later they conveyed into oil troughs. The oil temperature is kept at 180-240°C. Paddles gently push the slices along. As the slices flip-flop, salt is sprinkled over it through the receptacles positioned above the trough at the rate of 0.79kg per 45.4 kg of chips.

## • Cooling and sorting

A wire mesh belt pulls out the hot chips from oil trough and moved along the mesh conveyer belt where excess oil is drained off and the chips begin to cool. They then move under an optical sorter that picks out damaged and any burnt slices and removes them with puffs of air.

## Packaging

The chips are packed into standard sized bags. Its also fully automatic procedure. The filling process must be accomplished without letting an overabundance of air into the bag, while also preventing the chips from breaking. Many manufacturers use nitrogen to fill the space in the bags. The sealed bags are conveyed to a collator and hand-packed into cartons. These days, awareness on environmental cleanliness, companies pack potato chips in paper cans of various sizes.

## 5. Quality standards and control

#### **Standard Specifications**

It has been observed that all varieties of potato are not suitable for processing. The dry matter and reducing sugar content are two important parameters for selecting raw materials for processing. The varieties namely Kufri Chipsona-1, Kufri Chipsona-2, Kufri Chipsona-3, Kufri Chipsona-4, Kufri Frysona and Kufri Himsona released by Central Potato Research Institute (CPRI), Shimla, have been found fit and beneficial for potato processing. The following are the characteristics of potato meant for processing purposes:<sup>15</sup>

Particulars	Specifications
Tuber Shape	Round to Oval
Tuber Size, mm	45-80
Eyes	Shallow
Specific Gravity	>1.08
Dry Matter, %	>20
Reducing Sugar, % fr Wt	<0.1
After Cooking Discoloration	-
Texture	Fairly fi rm to mealy

Specifications under Bureau of Indian Standard related to processing of Chips may be referred as:

IS: 4626-1978 IS: 2860-1964 IS: 7254-1974

The Food Safety and Standards (Licensing and Registration of Food Businesses) Regulations 2011 introduced to improve the quality, hygiene and cleanliness of food has brought about tremendous changes in the food industry. As per the Act, no person shall commence any food business except under a FSSAI license or FSSAI registration. Therefore, any food manufacturing or processing or packaging or distributing entity is now required to obtain a FSSAI License or Registration. It is issued by the Food Safety and Standards Authority of India (FSSAI), Ministry of Family Health & Welfare, Government of India.

<sup>&</sup>lt;sup>15</sup> Post-Harvest Manual for Export of Potatoes, APEDA, New Delhi

For quality control, samples are chosen hourly from each batch throughout the manufacturing process. The tasters check the chips for salt, seasoning, moisture, color, and overall flavor. Color is compared to charts that show acceptable chip colors.

#### **Pollution Control**

In terms of Air and Sound pollution, no major problem is associated with this project. For wastewater disposal, appropriate recycling system is managed so that water pollution will be controlled. However, entrepreneur should obtain NOC from concerned State Pollution Control Board.

#### Waste and Effluent Disposal

Rejected potatoes and peelings are sent to farms to be used as animal feed while the starch that is removed in the rinsing process is sold to a starch processor.

In case of effluent disposal, it should be treated with recycling facility or dumped in such a way that these does not cause environmental hazard in the vicinity of the site.

#### **Energy Conservation**

Proper care and management should be taken in order to use appropriate amount of fuel and electricity.

#### 6. Procurement strategy of raw material & other inputs

Potato is the fourth major food crop after rice, wheat and maize in Bihar. Bihar produces various varites of potatoes in large quantity among which Kufri Chipsona-1, Kufri Chipsona-2 and Kufri Chipsona-3 are cultivated in limited area for processing purpose. Nalanda, Patna, Vaishali, Saran, Muzaffarpur, Samastipur, Gopalganj, East and West Champaran, and Gaya account for 80 percent of the area and production in the state. Among these Nalanda, Patna and Vaishali are the foremost districts for production. Normally prices of fresh potato at the village level are much lower compared to that in the main wholesale market. This situation leads to farmers getting much less return on their produce. So, Potato's which will be required for manufacturing will be procured directly from the farmers. During the season as they are readily available in fresh form hence procurement will not be a problem. Many small auction centers operated at village level that collect the potato from the farmers and is further sold/ dispatched to other major market/ customers in the state and other state. In addition to this unit would also propose to sign contracts with the local farmers to ensure timely supply of the potato.

#### **Backward Linkages:**

The promoter has well established backward linkages for its proposed units and it is expected that the raw material can be procured from the local area. Raw materials are mainly Potato, Salt, Flavour and Spices etc.

#### Forward Linkages

Potato Chips has a great demand not only in the Town but also in the rural area. At present there are only few units who are manufacturing chips in organized way and other unites are very small capacity and are in unorganized sector and unable to fulfill the Market demand. The promoter has very good connect with the buyers and as he was already in the trading business of Namkeen so he is well aware of entire supply chain.

#### 7. Marketing strategy

The rising number of health-conscious consumers is giving a boost to RTS juices; it has been observed that consumers are shifting to RTS as they consider the same as a healthier breakfast/snack option. Mango drinks are popularly used in most urban households.

Today markets are flooded with a large variety of juices e.g., mango, apple, guava, litchi, grapes, pineapple etc. The main reason for increased consumption is rising level of health consciousness among consumers and parents. It is believed that these drinks provide superior nutrition because of their fortified status. Factors like preferred choice of children, easy availability, convenience, naturalness and marketing strategies have given RTS drink industry a booming growth.

With changing lifestyles and increase in disposable incomes, the demand for easy-to- prepare drink is also increasing. Besides consumption in the households, it is served in hotels, restaurants, clubs, airlines and railways etc.

Quality should be emphasized at each step right from the beginning to the marketing of the Product. Over the years, an image of high-quality products should be cultivated.

The effectiveness of distribution coverage and practice is of paramount importance in achieving the desired RTS juice sales. Understanding of the distribution channels is crucial for the manufacturer to plan and implement an effective distribution strategy. Distribution network should be given extra emphasis. Market share could be gained by enhancing retailer, and distributor margins. Normally distribution and retailer margins in RTS juice business are from 15 to 20%.

Promoters would appoint distributors in targeted towns of Bihar and surrounding states like West Bengal, Jharkhand, Uttar Pradesh. Contacts with retailers of similar kinds will be made and products would be sold in the market with help of them. The product made in this unit will be in the line with top range of products with better quality at the same time cost effective. Company would be sharing more profits with the distributors and retailers.

Company will also explore possibility of marketing their produce to retails shops like Big Bazar, Reliance Trends, Malls etc. It will also try to partnership with local and other hotels and restaurants with good offers to attract demand of its product. It is assumed that due high quality, cost effectiveness and aesthetic packaging, sale of products may not face much problems.

#### 8. Land Details

#### Land Details

In order to set up a modern biscuit manufacturing unit of the proposed capacity, a land size of approx. 18 to 20 Decimal would be ideal however this may vary with increase in capacity.

#### The land proposed for the unit Details of the proposed land is given below:

Sale deed dated 18.10.2016 in the name of M/s XYZ with sale value Rs. 0.00/-

Khata no.	Plot no.	Area	Boundary
	Total	19 decimals	

(In case of leased land the minimum lease duration should be 30 years)

#### 9. Project impact

As discussed earlier, the project will have various positive impacts such as:

**Infrastructure for value addition:** This unit would aim to integrate and streamline existing value chains in the region by creating centralized infrastructure for value addition and preservation. The unit will thus provide benefits on cost, quality and convenience for sustainable growth in the market driven economy. The unit has been envisaged in a way that it would ensure better returns to all players in each level of value chains ranging from procurement, storage, processing, packaging to distribution of food commodities through vertical integration of functions and horizontal linkages of destinations.

**Reduction of Wastages:** The infrastructure created at the unit along with the integration of backward and forward linkages would lead to more efficient supply chains and reduction of wastages. This would provide higher value realization to all players in the supply chain including the farmers.

**Creation of employment:** The project shall generate employments. It is estimated that the it would generate direct employment of about 14 workers and indirect employment of another 30 workers. Most of the manpower requirement will be met from the local area.

**Return to farmers:** The unit will be benefiting farmers in the region by increasing the returns for farmers by decreasing wastages and increasing demand of the agricultural produce
